

IMAGE RIGHTS & AI DISCLOSURE

Chaiwala Co. – AI-Built Brand Campaign Kit

1. Image Rights Statement

All seven campaign images included in the Chaiwala Co. academic campaign project were generated using ChatGPT from prompts created for the project. The images are AI-generated visual assets and are not represented as documentary photographs, real customer testimonials, or commissioned photography. They were produced for academic coursework, campaign design exploration, and presentation purposes.

The project acknowledges that the rights and permitted uses of AI-generated outputs are subject to the applicable terms and policies of the AI service used, and may also be affected by third-party rights. This statement does not assert exclusive copyright, guaranteed copyright protection, or unrestricted commercial rights in the images. Before reproducing, distributing, adapting, or using the images commercially, the relevant ChatGPT/OpenAI terms applicable at the time of use should be reviewed.

The images should be checked for unintended resemblance to existing copyrighted artwork, trademarks, recognizable individuals, or other third-party material. Any third-party logos, platform marks, brand references, fonts, or other assets incorporated into a design should be used only in accordance with the applicable permissions and terms. If the visuals are revised or reused outside the original academic context, the changes and intended use should be documented and reviewed.

The Chaiwala Co. brand in this project is a fictional academic brand concept. The generated images are presented as creative campaign mock-ups, not as proof of a real product launch or commercial endorsement.

2. AI Disclosure Statement

Generative AI was used to support the creation of the Chaiwala Co. campaign kit. ChatGPT was used to generate all seven campaign images and to assist with campaign planning, prompt drafting, caption ideation and refinement, and the preparation of brand-fit evaluation questions. Gemini and Microsoft Copilot were used for research assistance, brainstorming, and exploring campaign and audience-related ideas. Microsoft Designer was used as a supporting design tool in the wider creative workflow; however, the seven final campaign images included in this report were generated using ChatGPT.

The AI tools provided drafts, ideas, and generated visual content. The student reviewed and selected outputs, refined prompts and captions, aligned materials with the supplied brand brief, assembled the campaign assets, created a Google Form for review, collected feedback from respondents, and interpreted the results. Responsibility for the final submitted work and its accuracy remains with the student.

The project was developed for academic purposes using a fictional brand and campaign context. No claim is made that the campaign was commercially released or that the assets produced verified sales, reach, or market impact. This disclosure should be amended if additional tools, substantial edits, or new AI-generated materials are introduced.

3. Short Disclosure for Use Beside the Campaign

AI Disclosure: The campaign visuals were generated using ChatGPT. Gemini and Microsoft Copilot supported research and ideation, while ChatGPT also assisted with caption development and evaluation-form wording. The final content was reviewed and curated by the student for this academic project.
